Se puede ~~observar~~ <sup>precondición</sup> que lo <sup>wp(S, POST)</sup> ~~precondición~~ implica a lo <sup>precondición</sup> ~~wp(S, POST)~~ ya que  $|S| > 0 \wedge 0 \leq i < |S|$  está presente tanto en lo Pre como en lo wp(S, POST) y además lo wp(S, POST) dice que ~~que~~ todos los elementos de ~~S~~ <sup>S</sup> exceptuando  $S[i]$  están en <sup>su</sup> misma posición en  $S_0$  y  $S[i] = 43 = S_0[i]$  o bien  $S[i] \neq 43 \neq S_0[i]$ . Por lo que al pedir en la precondición que  $S = S_0$  estamos terminando de cumplir lo que nos pide la wp(S, POST) ~~porque~~

Y TODO ESTO QUIERE DECIR QUE EL PROGRAMA ES CORRECTO SEGUN SU ESPECIFICACIÓN
